

You are given this er diagram (simple booking app), you need to implement this in fastapi, you need to define all these tables first(total 9 models) and then create CRUD api for all these tables

GET get all records
GET get by id

POST create record in db
PUT update record in db

DELETE delete record from db

Properly format your code into this structure:

Like you will have app folder where you will be running this application , model folder where you will be defining your tables, schemas folder where you will be handling validation and api folder where you will be defining routes
